 Stanford Achievement Test Spring of 2008
 TOTAL TEST AVERAGE – Grade Equivalent

Grade Equivalents show the grade level of students for whom a score is average or typical. For example, a grade equivalent of 4.8 means that the child’s score is the same as what the average score of children in the eighth month of the 4th grade would have been if these children had taken the same test.

Grade Equivalents do not show the level of the test. For example, a grade equivalent of 6.8 on a 4th grade test **does not** mean that the child can handle 6th grade work. It means that if sixth graders took the same test in April, the typical score would be the same as that fourth grader’s score.
